

# PFA1' scheme in SinglePion+0PU: $E_{T,RH}$ vs $E_{T,TP}$

- **s/w TPs synchronized with f/w TPs :**

- TPs with underestimated energy(w/ single layer saturation at 64 GeV) is bumped to 128 GeV.
- There exists the sharp cutoff at 64 GeV in HE( $|\eta| \geq 21$ )
  - Since we divide the TP energy by 2 to mimic phi segmentation
  - Fixed in s/w in [PR #37196](#), but will be reverted since it is not yet implemented in f/w and we need matches between s/w and f/w in production release(CMSSW\_12\_3\_X)

\*RH ET is also divided by 2 in HE ( $|\eta| \geq 21$ ) to obtain tower energy
